

Specifications

Versatile and Affordable

RainTube can be configured to work with any roofing material from asphalt shingle to slate and even works with flat or low-pitch commercial systems.

RainTube retrofits neatly into existing installations with no mechanical attachments to the structure or roof.

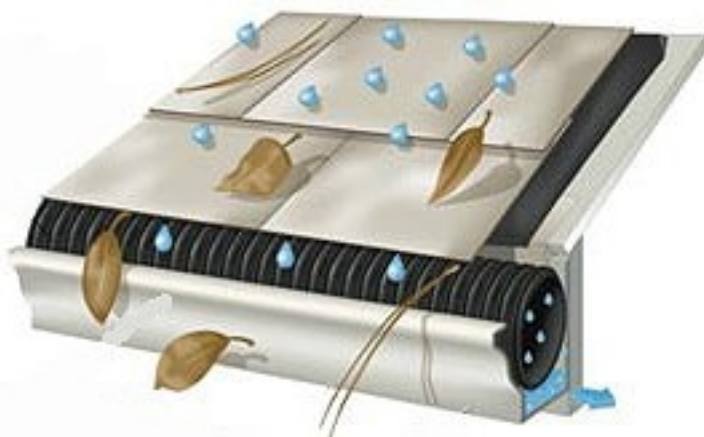

RainTube protects homes, wineries, horse arenas, barns, storage and industrial facilities. Works well with oversized box, half-round, copper and custom sized gutters.

New, retrofit, and green applications

RainTube used in custom residential applications reduces maintenance and improves the functionality of gutters. Helps prevent damage caused by uncontrolled rainwater runoff increasing life of structure.

RainTube improves collection efficiency of rooftop rainwater harvesting and catchment systems. A green product, RainTube is made from 100% post-consumer recycled materials and is 100% recyclable.

RainTube provides economical, effective gutter protection for investment properties including offices, apartments, and town-homes. Normal investment payback within 2 years on reduced maintenance alone.

Installation

The RainTube Professional Installation Process

Inspection

We perform an 11-point inspection to ensure that your gutters and downspouts are in good condition. We will never install our system if your gutters are in poor shape, and we will tell you what repairs (if any) are needed.

Clean & Tune-Up

We thoroughly clean your gutters and flush out all downspouts to ensure your gutters are free-flowing and working like they are supposed to.

Installation

We install our patented RainTube technology into your existing gutters. The RainTube system uses a hollow, porous, cylindrical HDPE tube that fills the gutter, keeping clogging debris out yet allowing the free flow of water. The RainTube is a "green" product, recyclable and made from recycled material.
